In the 1930s and 1940s, smoking became the norm for both men and women in the United States, and a majority of physicians smoked. At the same time, there was rising public anxiety about the health risks of cigarette smoking. One strategic response of tobacco companies was to devise advertising referring directly to physicians. As ad campaigns featuring physicians developed through the early 1950s, tobacco executives used the doctor image to assure the consumer that their respective brands were safe. These advertisements also suggested that the individual physicians' clinical judgment should continue to be the arbiter of the harms of cigarette smoking even as systematic health evidence accumulated. However, by 1954, industry strategists deemed physician images in advertisements no longer credible in the face of growing public concern about the health evidence implicating cigarettes.

In retrospect, these advertisements are a powerful reminder of the cultural authority physicians and medicine held in American society during the mid-20th century, and the manner in which tobacco executives aligned their product with that authority. Even before modern epidemiological research would demonstrate the health risks of smoking at mid-century, there had already arisen considerable concern about the health impact of cigarette use. Questions of the moral and health consequences of cigarette smoking that had been prevalent at the beginning of the 20th century still lingered. Although many physicians were unconvinced by this older research, some had begun to recognize a disturbing increase in lung cancer, and some had also started to consider the respiratory and cardiovascular effects of smoking. A common theory held that cancer resulted from chronic irritation to the affected tissue, and many wondered whether cigarette smoke "irritated" lung tissue in this manner.
Well aware of these concerns—and their impact on cigarette sales—the tobacco companies devised advertising and marketing strategies to (1) reassure the public of the competitive health advantages of their brands, (2) recruit physicians as crucial allies in the ongoing process of marketing tobacco, and (3) maintain the salience of individual clinical judgments about the health effects of smoking in the face of categorical scientific findings.

These elements would be of growing importance as the health effects of smoking came to be more fully elucidated. One aspect of these promotional strategies was to refer directly to physicians in both images and words. We explored how physicians were depicted in these advertisements and how the ad campaigns developed as health evidence implicating cigarette smoking accumulated by the early 1950s.

**EARLY MEDICAL CLAIMS**

American Tobacco, the leader in the splashy ad campaigns that had made its Lucky Strike brand dominant by the late 1920s, was the first to mention physicians in advertisements. As cigarette sales grew exponentially in the United States in the early 20th century, Lucky Strikes had become the preeminent brand largely because of its massive promotional efforts. Company president George Washington Hill worked with ad man Albert Lasker to develop a “reason why” consumers should purchase their brand. With no real scientific evidence to back their claims, American Tobacco insisted that the “toasting” process that Lucky Strikes tobacco underwent decreased throat irritation. In fact, Lucky Strikes’ curing process did not significantly differ from that of other brands.

Related campaigns emphasized that “Luckies” would help consumers—especially women, their new market—to stay slim, since they could “Reach for a Lucky instead of a sweet.” Along with these persistent health claims, a typical advertisement from 1930 boldly stated that “20,679 Physicians say ‘LUCKIES are less irritating’” and featured a white-haired, white-coated doctor with a reassuring smile (Figure 1).

In this manner, American Tobacco advertisements reflected an awareness of ongoing public concern about the potential health effects of cigarette smoking. Referring to a large number of physicians who they claimed backed up the superiority of Lucky Strikes, the ad text noted in small print that their accounting firm had “checked and certified” this number, independently validating the claim. Their advertising agency, Lord, Thomas and Logan, had sent cartons of cigarettes to physicians in 1926, 1927, and 1928 and asked them to answer whether “Lucky Strike Cigarettes... are less irritating to sensitive and tender throats than other cigarettes.”

Touting the toasting process in the accompanying cover letter, advertising executive Thomas Logan pointed out the virtues of Lucky Strikes and claimed that...
they had heard from "a good many people" that they could smoke Lucky Strikes "with perfect comfort to their throats." American Tobacco used the physicians' responses to this survey to validate their claim that Lucky Strikes were "less irritating," claiming it confirmed their enduring assertion that their "toasting" process made cigarettes less irritating. Toasting, the advertisement went on to explain, was "your throat protection against irritation—against cough." Although there was no substantive evidence that this process of curing tobacco was superior to the methods used by other companies, American Tobacco made the bold claim and tied it to physicians.

By the mid-1930s, Philip Morris, a newcomer to the market, took the use of health claims a step further, designing a campaign that used a new strategy of referring directly to research conducted by physicians. Both in magazines targeted to the general public and in medical journals, Philip Morris claimed that their cigarettes were proven to be "less irritating." For example, in a 1937 Saturday Evening Post advertisement, Philip Morris's hallmark spokesman, bellhop Johnny Roventini, announced that according to "a report on the findings of a group of doctors... when smokers changed to Philip Morris, every case of irritation cleared completely and definitely improved" (Figure 2). The text referred specifically to faithful doctors "day after day... [keeping] a record" to "prove conclusively" the decrease in irritation. These "findings" resulted from an aggressive pursuit of physicians and focused on the concept that adding a chemical to their cigarettes, diethylene-glycol, made them moister and less irritating than other brands. As Alan Blum, editor of the New York State Journal of Medicine, explained in his 1983 assessment of cigarette advertisements that had appeared in the journal from 1927 to 1953, Philip Morris—armed with papers written by researchers that the company had sponsored—attempted to use "clinical proof" to establish the superiority of their brand. Specifically, Columbia University pharmacologist Michael Mulinos and physiologist Frederick Flinn produced findings (on the basis of the injection of diethylene-glycol into the eyes of rabbits) that became the centerpiece of the Philip Morris claim that diethylene-glycol was less irritating, although other researchers not sponsored by Philip Morris disputed these findings.

This highly successful campaign made Philip Morris into a major brand for the first time. As a 1943 advertisement in the Saturday Evening Post proclaimed, Philip Morris provided "[t]he results... in medical journals by men, high in their profession—regularly offered to physicians on request." These advertisements used physicians and science to make their particular brand appeal to the broader public while at the same time they curried favor with physicians. Company operatives appeared at medical conventions and in physicians' private offices, providing physicians with free cigarettes and reprints of scientific articles on the subject. As a 1936 Fortune Magazine profile of Philip Morris & Company made clear:

The object of all this propaganda is not only to make doctors smoke Philip Morris cigarettes, thus setting an example for impressionable patients, but also to implant the findings of Mulinos so strongly in the medical mind that the doctors will actually advise their coughing, rheumy, and fur-tongued patients to switch to Philip Morris on the ground that they are less irritating.

With careful, deferential appeals to physicians, Philip Morris aimed to gain their approval. The specific positive references to clinical evidence that had appeared in medical journals helped to establish and maintain this connection between physicians and tobacco companies, and between health and cigarettes.

TOBACCO INDUSTRY COURTS DOCTORS

According to a number of accounts, medical professionals—having themselves joined the ranks of inveterate smokers—doubted the connection between smoking and disease after 1930. Although hygienic and physiological concerns continued...
to be voiced, clinical medicine claimed that individual assessment and judgment was required. During this era, there was a strong tendency to avoid altogether causal hypotheses in matters so clearly complex. There was—and would remain—a powerful notion that risk is largely variable and thus, most appropriately evaluated and monitored at the individual, clinical level.

According to this logic, some people could smoke without risk to health, whereas others apparently suffered untoward and sometimes serious consequences. As cigarette smoking became increasingly popular in the early decades of the 20th century, medicine offered no new insight into how best to evaluate such variability other than on an individual post hoc basis. If, and when, an individual developed symptoms, a physician might appropriately advise restricting or eliminating tobacco. As a result, rather than being located within the sphere of public health, cigarette use remained within the domain of clinical assessment and prescription. The tobacco industry would actively seek to keep cigarettes within this clinical domain.

For the tobacco companies, physicians’ approval of their product could prove to be essential, especially since patients often brought smoking-related symptoms and health concerns to the attention of their doctors. Through advertisements appearing in the pages of medical journals for the first time in the 1930s, tobacco companies worked to develop close, mutually beneficial relationships with physicians and their professional organizations. These advertisements became a ready source of income for numerous medical organizations and journals, including the New England Journal of Medicine and the Journal of the American Medical Association (JAMA), as well as many branches and bulletins of local medical associations.

Coming during the Great Depression, the placement of advertisements in medical journals helped to keep medical organizations financially solvent when resources were scarce. Philip Morris praised physicians in these advertisements with taglines like “Every doctor is a doubter” and “Doctor as judge” as they appealed to physicians’ expert ability to evaluate the evidence, referring them to scientific articles that they claimed illustrated the superiority of their brand. As one such advertisement explained in its entirety in 1939, “If you advise patients on smoking—and what doctor does not—you will find highly important data in the studies listed below. May we send you a set of reprints?”

Not only, then, did physicians’ findings help to make the Philip Morris brand appear superior in the eyes of the public, but the company also turned to physicians with great effect. Physicians became, through this process, an increasingly important conduit in the marketing process.

**RJ REYNOLDS’S MEDICAL RELATIONS DIVISION**

Although Philip Morris may have created this strategy—and gained a leg up in the competitive cigarette market—RJ Reynolds became the leading force in soliciting physicians. Reynolds created a Medical Relations Division (MRD) in the early 1940s that became the base of their aggressive physician/health claims promotional strategy. They directly solicited doctors in a 1942 advertisement that appeared in medical journals describing the MRD. Declaring that “the most significant medical data is derived from the every-day records of practising [sic] physicians,” the text asserted “your office record reports in such cases should prove interesting to study.”

The MRD, including its long-time director, A. Grant Clarke, was in fact a part of RJ Reynolds’s advertising firm, rather than any kind of professional scientific division of the company. The MRD’s mailing address was the side door of the William Esty Advertising Company. The work of the MRD focused on promoting Camels mainly through finding and courting researchers to help substantiate the health claims RJ Reynolds made in their advertisements.

In the late 1930s and early 1940s, Clarke—who had no medical or scientific training—corresponded with many researchers who were pursuing questions relating to smoking and health. The MRD financed research that Reynolds then referred to in advertisements. Rather than emphasizing claims of moistness as Philip Morris had done, RJ Reynolds focused on nicotine absorption, insisting that Camels were the slowest burning of all cigarettes. The safety of nicotine—like the issue of chronic irritation—was a source of ongoing concern; Reynolds maintained that nicotine was “the chief component of pharmacologic and physiological significance.” Camels’ slow burning rate, their advertisements now asserted, decreased nicotine absorption; as a result, Camels offered smokers an advantage over other, faster-burning brands.
As they made this claim, RJ Reynolds also asked physicians to use the information when advising their patients. They referred to "a number of reports from physicians who recommend Camels" and called on those reading the advertisement to send in their own clinical experiences and to request copies of medical journal articles from the MRD that proved their assertions. The offer served to legitimate RJ Reynolds's claims. The main article cited did not in fact address Camels specifically, although it did make the claim that slow-burning cigarettes were superior. With no clear knowledge about whether nicotine absorption was even an area that should concern smokers, and with very little data showing Camels' slower absorption, the scientific basis for Reynolds's claim remained obscure.

Nonetheless, such health claims would become the basis for the aggressive recruitment of physicians as allies in the promotion of their products and brands. Tobacco companies' participation in medical conventions provided a clear example of their efforts to appeal to physicians. For example, social commentator Bernard Devoto described the exhibit hall of the 1947 American Medical Association (AMA) convention in Atlantic City, where doctors "lined up by the hundred" to receive free cigarettes. At the 1942 AMA annual convention, Philip Morris provided a lounge in which doctors could relax and socialize. The lounge, an advertisement explained, was "designed for your comfort. Drop in. Rest . . . read . . . smoke . . . or just chat." Besides welcoming physicians to the convention, Reynolds touted their scientific research into cigarettes. In an advertisement that appeared in medical journals across the country in the weeks before the 1942 AMA meeting, Reynolds reiterated their claim that "[t]he smoke of slow-burning CAMELS contained less nicotine than that of the 4 other largest-selling brands tested," and continued to direct its health theme at doctors. The advertisement also referred to "the interesting features of the Camel cigarette exhibit," including "the dramatic visualization of nicotine absorption from cigarette smoke in the human respiratory tract" and "giant photo-murals of Camel laboratory research experiments." At a time when laboratory science had garnered especial admiration, the advertisement linked clinical medicine to the authority of investigative science.

Along with directly soliciting physicians, the tobacco advertisements portrayed a glowing image of physicians in both medical journals and popular magazines. In advertisements that were precursors to the "More Doctors" slogan, RJ Reynolds specifically featured dedicated physicians serving their country and its soldiers during World War II. As a 1944 advertisement that appeared in Life Magazine entitled "Doctor of Medicine . . . and Morale" illustrated, doctors on the front received hero status:

He wears the same uniform . . . He shares the same risks as the man with the gun . . . Yes, the medical man in the service today is a fighting man through and through, except he fights without a gun . . . [H]e's a trusted friend to every fighting man . . . [H]e well knows the comfort and cheer there is in a few moments' relaxation with a good cigarette . . . Camel . . . the favorite cigarette with men in all the services.

With this and similar advertisements, the positive place that physicians held in American culture was both exploited and underlined by RJ Reynolds's advertising schemes. Linking physicians to wartime patriotism further elevated their status and, with it, Camel cigarettes.

**THE "MORE DOCTORS" CAMPAIGN**

When the "More Doctors" campaign began in January 1946, it also focused on the respected and romantic image the medical profession had achieved in American society. Featuring 6 illustrations of physicians with patients—in the laboratory or sitting back with cigarette in hand—this first advertisement personalized the physician for the readers of such popular magazines as Ladies' Home Journal and Time. Prefaced with the bold statement that "Every doctor in private practice was asked—family physicians, surgeons, specialists . . . doctors in every branch of medicine," the
advertisement touted the thoroughness of their survey and insisted that "yes, your doctor was asked ... along with thousands and thousands of other doctors from Maine to California."

By linking their depiction of physicians to the consumer's own physician, Reynolds brought immediacy to their claims. Any fears that smoking might be harmful were also easily contradicted by the physician's being a smoker himself. Admirable, forthright physicians—including the consumer’s own—had "named their choice," and that choice, the advertisement insisted, was Camels, hands down.

Even though a few of these advertisements did appear in print, the Reynolds advertising department soon realized that they might have overstepped their evidence. With the Federal Trade Commission already challenging suspected health claims in cigarette advertisements, RJ Reynolds toned down their copy, quickly shifting their claim to "113,597 physicians" surveyed rather than all physicians.31

At least some individual physicians questioned the original claim. In a letter to Howard T. Behrman, a physician who had requested "more specific information concerning the survey of physicians' smoking preference," RJ Reynolds advertising executive W.T. Smither assured him that the surveying had been thorough and scientific. Explaining that the question about brand preference had been embedded in a survey that included less relevant topics—such as medical journals, medical conventions, and numerous consumer products—Smither emphasized how 3 independent surveys had garnered "similar findings, and in doing so, served to confirm the accuracy of each other."32

Beyond the questionable methods used to gather data, Reynolds was also careful how they described the survey findings in advertising copy, making sure to avoid conflating doctors' choice of a cigarette with any belief on their part that Camels were healthier. In their advertisements, they asserted, "Doctors smoke for pleasure just like the rest of us."33 Internally, Reynolds’s advertising executives cautioned William Esty, their advertising company, to be careful of what they claimed, insisting that "in no way should the copy... intimate that doctors recommended smoking of CAMEL5, [or] that CAMELS are good for health."34 This cautionary approach reflected the growing industry concern about potential regulation and litigation.35

Even so, the "More Doctors" campaign resonated effectively with American cultural values about contemporary medicine. Throughout 1946, the slogan flooded print, radio, and television media. Doctors were often idealized, as in the 1946 advertisement "I'll be right over!" Here, a middle-aged physician, in bed in his pajamas, telephone in hand, is about to grab the black bag lying ready on his bedside table and make a middle-of-the-night visit to a patient in need:

24 hours a day your doctor is "on duty." ... [In his daily routine he lives more drama, and displays more devotion to the oath he has taken, than the most imaginative mind could ever invent. And he asks no special credit. When there's a job to do, he does it. A few winks of sleep... a few puffs of a cigarette... and he's back at the job again."36

This neighborhood family physician is saintly and deserving of trust, representing (as another 1946 advertisement explained) "an honored profession... his professional reputation and his record of service are his most cherished possessions."37 The importance of professional autonomy loomed large, and the industry was eager to sustain this view. As physicians geared up to fight the Truman administration's national health insurance proposals, their image as loyal and deserving of respect was especially important.38

Along with providing images of professional trustworthiness and dedication, the "More Doctors" ad campaign also exploited the popular faith and admiration of medical science and technology. In one such "More Doctors" ad, a 5-year-old girl sits next to her mother in a doctor's office and proclaims, "I'm going to grow a hundred years old" (Figure 4).
Referring to the "amazing strides in medical science [that] have added years to life expectancy," the advertisement goes on to "thank medical science for that. Thank your doctor and thousands like him... toiling ceaselessly... that you and yours may enjoy a longer, better life." With medical advances having captured popular imagination, connections drawn between scientific discovery and Camel-smoking doctors added to the appeal of their cigarette of choice. After the initial onslaught of heroic physicians and medical miracles in 1946, the "More Doctors" advertisements in 1947 and 1948 continued to remind readers about the survey as the focus of the advertisements shifted. The main slogan of one such campaign was "Experience is the best teacher." In this series of advertisements, RJ Reynolds explained that the cigarette shortage created by the war had forced many to smoke whatever brands were available, and this experience, they claimed, had made the superiority of Camels' quality clearly evident. The smoker was able to tell the difference between brands, and such "experience" translated to other areas where someone might have know-how. When the slogan appeared in magazines like Life and Saturday Evening Post, the "experience" cited might be that of a talented celebrity athlete able to discern quality in his or her sport. In medical journals, the references were to famous scientific researchers. These advertisements championed physicians and medicine and reminded their audience again that "More doctors smoked Camels" as they also continued to praise science. But the idea of "experience" also figured into another prevalent theme communicated in RJ Reynolds's advertising—that of individual authority, both the physician's and the individual consumer's. The question of throat irritation so central to many 1920s and 1930s campaigns again emerged here as RJ Reynolds introduced a "mildness" theme. With the central claim that Camels did not irritate the throat, Reynolds featured both the physician-researcher and the everyday smoker to convince readers of Camels' mildness. In July 1949 issues of both local and national medical journals, RJ Reynolds asked, "How mild can a cigarette be?" In answering this question, the advertisement juxtaposed a "doctor's report"—illustrated with a physician, cigarette in hand and head mirror strapped around his brow—with a "smokers report"—illustrated with a smiling "Sylvia MacNeill, secretary." Physicians, the advertisement explained, had concluded after scientific investigation that there was "not one single case of throat irritation" from smoking Camel cigarettes. In fact, "noted throat specialists" had conducted "weekly examinations" of patients in making this determination. Reynolds used this depiction of careful, clinical observation to substantiate their health claim (Figure 5). The advertisement went beyond medical authority, however, asserting that smokers didn't even have to take their physicians' word for it. Instead, they could take their "own personal 30-day test," as Sylvia MacNeill had done. She concluded that she "knew" that "Camels are the mildest, best-tasting cigarette I ever smoked." Advertisements in popular magazines took smokers' ability to judge for themselves even further, with Elana O'Brian, real estate broker, declaring in a typical example, "I don't need my doctor's report to know Camels are mild." The advertisement underlined her assertion with photos of 6 other smokers from various walks of life under the heading "Thousands more agree!" In another example, Anne Jeffrey, a stage and screen star, insisted, "The test was fun and it was sensible!" Parallel to earlier solicitation of physicians' opinions, in this series of advertisements RJ Reynolds requested that smokers determine the safety of Camels on their own and praised their acumen. With some advertisements calling on
smokers to "Prove it yourself" and even guaranteeing a money-back guarantee for dissatisfied customers, Reynolds insisted on the superiority of their product. These advertisements worked to subvert the emerging population-based epidemiological findings by emphasizing the primacy of "individual" judgment.

By 1952, advertising copy went beyond the typical individual smoker to emphasize the sheer volume of people who chose Camels as their cigarette. Highlighting that Camel was "America's most popular cigarette by billions," the ad copy mentioned that "long before Camel reached those heights, repeated surveys showed that more doctors smoke Camels than any other cigarette." The cigarette's popularity in itself became a selling point: how could so many people be wrong? And physicians' cigarette choice served to confirm this popularity. As the heading of a similar advertisement explained, "The doctors' choice is America's choice."  

**THE DISAPPEARING DOCTOR**

Ultimately, however, the use of physicians in Camel advertisements could not be sustained as the health evidence against cigarettes accumulated. When disturbing scientific results connecting lung cancer and cigarettes began to emerge, Camel advertisements shifted away from physicians' judgment and authority. In 1950, the publication of the now-famous work of Evarts Graham and Ernst Wynder in the United States—as well as that of A. Bradford Hill and Richard Doll in the United Kingdom—showed that there was cause for alarm. The reporting of their findings connecting lung cancer to cigarette smoking in national magazines like *Time* and *Reader's Digest*—and the corresponding declines in sales and stock prices—forced tobacco executives to assess strategies for responding to growing medical and public concerns about their product.

By 1953, when Wynder, Graham, and their colleague Adele Croninger published laboratory findings confirming that cigarettes were carcinogenic, scientific findings constituted a critical threat to the industry. Tobacco executives were well aware both of these findings and of the public attention they were receiving, and their statements and actions reflected an understanding that this new scientific evidence constituted a full-scale crisis for their corporations.

Most notably, company executives realized that they would have to work together in the face of the scientific evidence. Although each company still sought an advantage over its competitors, the new health evidence threatened the future of the entire industry. In December 1953, the tobacco executives met to devise a joint strategy. They hired prominent public relations firm Hill & Knowlton to aid in this effort. As a planning memo makes clear, health claims were considered to be no longer viable. According to Edward Dakin, a Hill & Knowlton executive, it would be critical to develop some understanding with companies that, on this problem, none is going to seek a competitive advantage by inferring to its public that its product is less risky than others. No claims that special filters or toasting, or expert selection of tobacco, or extra length in the butt, or anything else, makes a given brand less likely to cause you-know-what. No

"Play-Safe-with-Luckies" idea—or with Camels or with anything else."  

Hill & Knowlton's advice was that the industry as a whole must desist from health claims that had been a centerpiece of the advertising that featured physicians. Such claims, the agency now contended, would now draw attention to the "health scare," as they professed to call it.

In popular magazines, the last notable reference to doctors in an advertisement came in 1954. After the other tobacco companies had left such marketing techniques behind, Liggett and Myers (which had declined participation in the joint industry program directed by Hill & Knowlton) made the claim that their L&M filter cigarette was "Just what the doctor ordered!" In a typical advertisement that appeared in a February issue of *Life* magazine, Hollywood star Fredric March made this assertion after having read the letter written by a "Dr Darkis" that was inset into the advertisement. Darkis explained in this letter that L&M filters used a "highly purified alpha cellulose" that was "entirely harmless" and "effectively filtered the smoke" (Figure 6). Dr Darkis was in fact not a medical doctor at all but a research chemist, yet another example of misrepresentation in a tobacco ad. More significantly,
this use of implicit doctor endorsement of cigarettes would not occur again in American advertising after this campaign. Much in the way that the industry had used doctors to reassure smokers in the 1940s, filter cigarettes were becoming the industry’s new strategy for appealing to consumers, whose concerns about the health risks of smoking would be repeatedly confirmed by new research studies. In 1950, filter cigarettes were 2% of the US cigarette market; by 1960, they were 50%.

In medical journals, the last-gasp attempt by a tobacco company to ally itself with physicians came in 1953, when the Lorillard Company appealed to physicians as they promoted their new filter cigarette, Kent. These advertisements queried, “Have you tried this experiment, doctor?” and “Why is it, doctor, that one filter cigarette gives so much more protection than any other?” One advertisement mentioned how “thousands” of physicians at a recent AMA convention witnessed “a convincing demonstration... of the effectiveness of the MICRONITE FILTER” and included photos of the experiment demonstrated there. In their marketing of Kent, Lorillard had created a campaign reminiscent of those designed by Philip Morris and RJ Reynolds in the 1930s and early 1940s. Just as in those earlier advertisements, Lorillard called on physicians to interpret scientific results using their individual, clinical judgment. But the swift and vehement reaction to these advertisements clearly illustrated how the social and scientific climate had shifted. A 1954 JAMA editorial labeled the reference to physicians and the AMA convention an “unauthorized and medically unethical use of the prestige and reputation of the American Medical Association.” No longer could tobacco companies count on physicians to serve as public advocates of their product.

In fact, in 1953 JAMA had decided to stop accepting cigarette advertisements in its publications and banned cigarette companies from exhibiting their products at AMA conventions. After conducting its own survey of physicians, the AMA explained in a letter to tobacco companies that “a large percentage of physicians interviewed expressed their disapproval” of cigarette advertisements in medical journals. Other JAMA advertisers had come to dislike having their products appear next to cigarette advertisements as well. With the AMA publicly condemning the Kent ad campaign in 1954 as "hucksterism," it became even more clear to tobacco companies that the purported allegiance with physicians was no longer feasible or effective.

One additional indicator of the growing medical disdain for cigarettes was the very fact that many physicians who followed the emerging health evidence began the process of giving up smoking. According to one study of physicians’ smoking practices in Massachusetts, nearly 52% had reported being regular smokers in 1954 (over 30% reported smoking at least a pack per day); just 5 years later, only 39% were regular smokers. Additionally, only 18% now reported consumption of a pack or more per day.

Although the industry would continue to solicit physicians with materials disputing the relationship between smoking and disease and would also seek out physicians who doubted the harmfulness of cigarettes in order to undermine emerging scientific findings, such efforts would be greeted with rising skepticism. The era of explicit use of physicians and health claims to promote smoking had ended even though the AMA would not publicly acknowledge the harms of cigarette smoking until 1978. The smoking physician had become a visual oxymoron. The industry would turn to new images and more sophisticated strategies to hawk their dangerous product.
