Abstract

The Internet has created countless possibilities for commemorations dedicated to tragic or catastrophic events and for exercising collective memory, which has not only gradually hidden our physical bodies but is also changing the way we experience the death of those around us. People who died in some extreme events could not be buried well. Meanwhile, their relatives shared collective memories and trauma. Thus, I want to create a digital cemetery that collects the digital "soul". Besides, the digital cemetery could gather the people who have relatives who died in the same event and experienced the same trauma, forming a place that not only communicates but can heal each other.

I will create a website as the main digital platform for the community where people can bury their loved ones in a virtual Constellations system and build them a monument. Along with an Augmented Reality mobile application mobile application, people can see the exact location of their relatives or friends buried in the constellation and resonate in the community. What's more, they can have an additional physical interaction device. When someone visits a buried person, the interactive device will produce haptic feedback, and people can experience tangible visualizations from the device and comfort from those who have shared trauma. To join the community or merely to experience it, both strains and reinforces the mutuality of the "Collective memory" said to be in this together.

Acknowledgment

Thanks to Ya'an Wei, Xiaoxia Zhang, and Shufang Tan as my first teammates for putting up the original idea of the Flower project; Tianwei Li and Masumi Ito for helping me with the storytelling and UI design during the Metaverse Hackathons; Harvard Innovation Lab for bringing this project into the community; and every critic from SJTU FourC Challenge Charrette Contest, MIT Reality Hack, and Harvard Metaverse Hackathon that helps with the project, especially Athena Demos, who has supported me from the very beginning.

Thanks to Feiyue Chen and Yalun Li for the inspiring peer critics; Hanpu Yao for the technical support; Yujin Cao, Xiaoji Zhou, Zhifei Xu and Tairan An for taking care of me during the final review. You all have pushed my project forward at some moments.

Thanks to Krzysztof Wodiczko and Malkit Shoshan, for your amazing advice, sharp critics, and the avant-garde vision; for your generous love, and for giving me the chance to start this fabulous journey and explore this environment; for allowing me to freely express my voice and imagination over the past three years, and for telling me to devote myself to the life-long fearless speech. Thank you, for everything.

Physical Devices

Situation 1:

Laina Tuckanow, 21, lost her 39-year-old mother, Danielle Rose Poorbear, in April, 2020. Tuckanow had a **rose tattooed** on her face with the name 'Danielle' as the stem to honour her mother, who died of COVID-19. The Regina woman says the pandemic has forever changed her life.

Device 1: Rose Media Player

An Arduino board linked to a cramp, tied to the flower branch, dipped in the water. The sensor could get the signal when the flowers are dipping in or without the water.

This device imitates the concept of tomb sweeping during funeral ceremony. Usually, for flower caring, we change the water in the vase every two to three days. When you lift up the flowers, the Arduino board can sense whether the flowers are out of the water and transmit the signal through WI-FI or Bluetooth that connects to the mobile application. Thus, specific sounds would be played based on your setting. It could be a voice message from people who visit your virtual memorial space, or just a song that reminds you of your loved ones.

Source: cultureguru.my/blog/life-hacks/

Situation 2:

The traditional funeral ceremony scripts usually contain a gesture of praying, either using joss sticks or praying with folded hands.

After observing the 911 Memorial, I noticed that nowadays people used to take a photo after their praying process, saving them as a shred of evidence that they had finished the memorial scripts.

Based on this common pattern, I design a new funeral ceremony script in the digital world - using mobile phones and camera lenses to observe the environment as well as process the memorial ceremony. I use a Web AR application to describe these processes.

Device 2: Personal Sacred

In this scene, the Mozart album is one's deceased grandfather's possessions. I create a web-based Augmented Reality application to represent the praying process.

In this new normal, you open the mobile phone camera and point it to the possessions, staring at the phone screen. After a while, more specifically, five minutes, based on your setting, some stars will appear on the screen. When you click on those stars, you can hear a 15 seconds music piece each from the Mozart album. When you finish playing the music, the stars disappear one by one, and your personal sacred memorial script is finished.

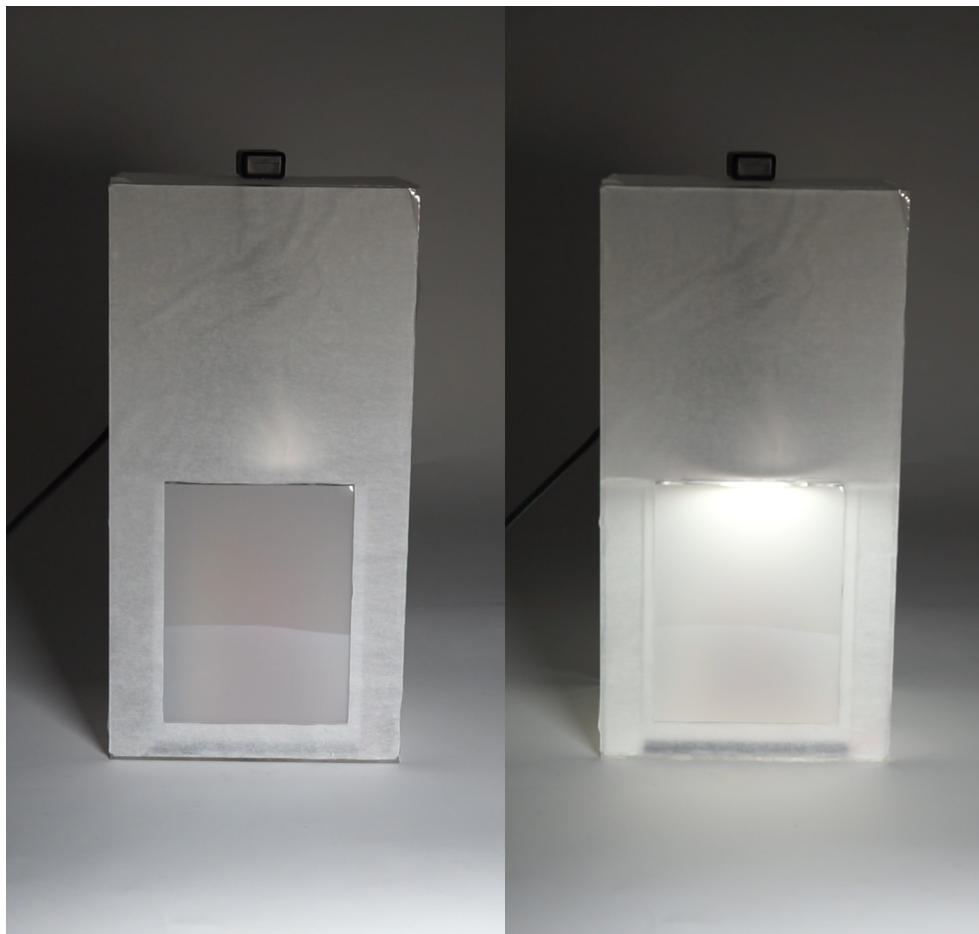

Situation 3:

Collective trauma during tragic or catastrophic events not only affects one or two people but has a huge impact on the community with shared memories. Not only the online digital cemetery should serve as a public monument that to remember the event, but also people should resonate in the community.

When someone visits a buried person, the interactive device will produce feedback, and people can experience tangible visualizations from the device and comfort from those who have shared trauma. To join the community or merely to experience it, both strains and reinforces the mutuality of the “Collective memory” said to be in this together.

Light Up

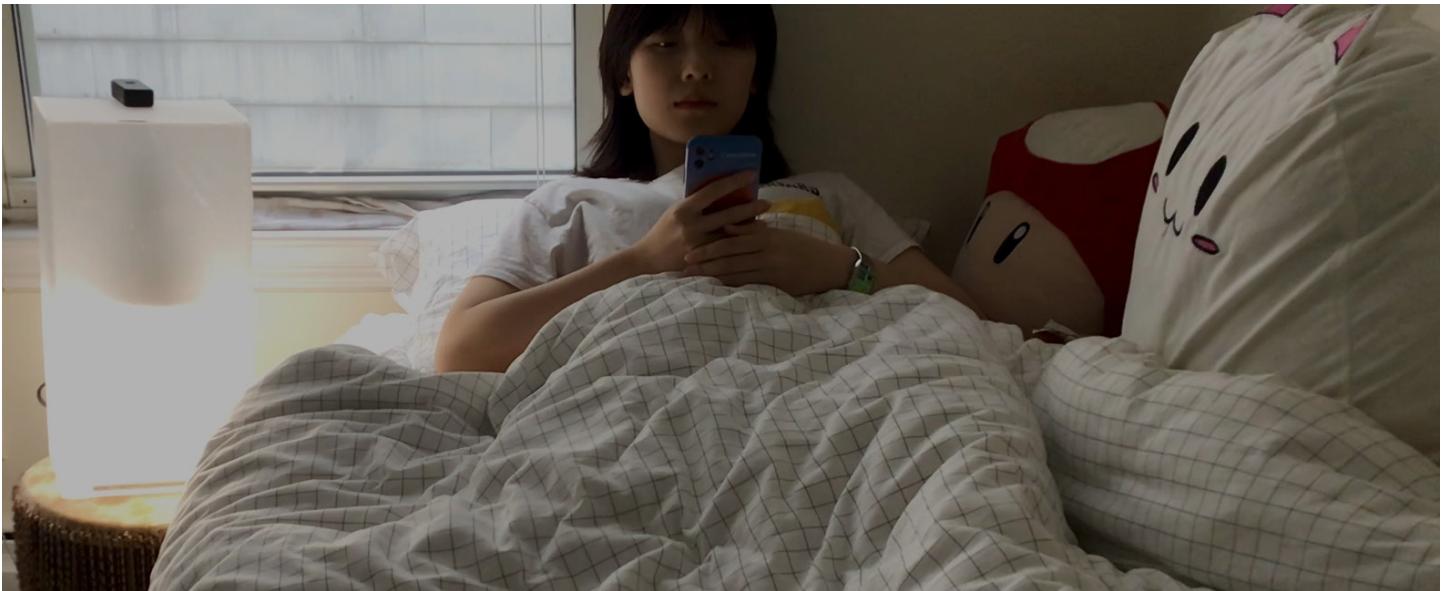

Device 3: Album Lantern

The album lantern is not only a drawer that stores your memorable object but emphasizes them and reminds you of your loved ones occasionally. Connected to Bluetooth or WI-FI, the lantern is normally served as a bedside lamp with an LED bulb. However, when someone visits your virtual memorial space on the mobile application, the LED bulb will change color to remind you, and the PDLC Switchable Electronic Adhesive Smart Glass will turn to clear mode and let you see through the lantern. Thus, your memorial item was revealed.

Memorial Day Event

For future development, we can imagine there are multiple ways of using the starlight memorial Web AR system as well as the physical devices. Users of the system are free to output their gestures and the culture of their own community.

1. For example, you can tap and plant the AR flower in any scene in the world base on maps and GPS location. You can put the physical flower on the 911 Memorial in central Manhattan, but also the virtual ones if you are not physically there.
2. On a memorial day, you can change the LED bulb color of your album lantern lighting devices at a specific time inside your community, as a memorial event.
3. You can also rearrange the location of your planet in the starlight memorial, to form a specific pattern or letter based on the culture of your community.
